SEENEX LAUNCHES SECURITY ACCESS CONTROL SYSTEM TO U.S. MARKET

**UNIVERS 3T Offers the Latest in Access Control Portal Technology
with Integrated Metal Detection Capabilities**

Washington, D.C., April 26, 2006 – (GovSec Conference & Exposition, Booth #2043) - Seenex Corporation, a provider of a proven access control platform for integrated physical security and inspection solutions for the homeland and international critical infrastructure security (CIS) markets, today announced that it is now offering UNIVERS 3T, the latest in access control portal technology to the United States market. UNIVERS 3T is a product developed by Italy-based Tonali S.p.A., the global leader in advanced security portal systems and biometric products.

UNIVERS 3T is the latest advanced security revolving door with three sectors and a built-in metal detector. The integration of one concealed sliding door which closes automatically whenever a metal object is detected is a unique feature on the market. As with every revolving door system, users can pass through in two directions using the first available sector. In the event of a metal detection alarm, the user occupying the affected sector will be guided by the automated security to quietly continue the revolution and exit the building.

As soon as the turnstile moves the affected sector from the now closed access to the building, the additional door re-opens, creating free passage for other users, unless, of course, another alarm is activated. In situations where a metal detection alarm is active, the cycle is not in any way adversely affected. The continuous rotation of the UNIVERS 3T system enables all users, both entering or leaving, to pass through, regardless of irregular situations, drastically improving passage flow while maintaining a high security level.

“The UNIVERS 3T is widely used in Europe and is an excellent system to address many of the issues facing United States’ organizations that are trying to better protect their facilities and those who occupy them,” said Paul Milone, co-founder and CEO for Seenex. “With the integration of metal detection and its proximity access card technology, UNIVERS 3T is not only a robust system for preventing unwanted objects and people from entering a building, but also offers discreet automatic access control to keep the flow of traffic for unauthorized users uninterrupted.”

About Seenex

Seenex is a technology and systems development company providing a proven access control platform for integrated physical security and inspection solutions for both the homeland and international critical infrastructure security (CIS) markets. Offering its own proprietary technologies and the innovative security products and services of its industry-leading partners (i.e. Tonali, Sun-Lite), Seenex is a one-stop-shop for integrated security solutions, including security portal systems, surveillance systems, biometric and security operations monitoring, explosive detection, electro-optical devices and other value-added subsystems. Founded in 2001, Seenex is a privately held company based in Washington, D.C. For more information on Seenex, visit www.seenex.com.
